brick planters
refurbished and new planters contain a selection of native greenery such as ngaio, pohutukawa and lancewood with grass below.
wide edges at an appropriate height provide comfortable seating and a larger custom size brick removes the domestic quality of common brick.

brick paving lines
integrate the new additions with existing brick elements surrounding the quad whilst providing a degree of structure and spatial definition.

large rod seating
simple stack-able geometric forms allow periodic re-configuration and add colour and interest whilst giving variation in seating options

wind breaks
give a sense of protection to help create more intimate spaces within the greater quad. porous screens create optimum turbulence free wind breaks and maintain visibility through the screens.
sections of timber slats give variation to the wind breaks and provide a framework for population by vines. the wind breaks will also provide docking locations for rubbish bins

bluestone
hard wearing and attractive stone paving will integrate the interior space of the foyer with the asphalt of the quad surrounding it.
